**RE: 5700 King Traffic Impact Study
57th Street and King Street
Shawnee, Kansas**

Dear Mr. Swords:

In response to your request and authorization, TranSystems has completed a traffic impact study for the proposed 5700 King development to be located generally in the southwest corner 57th Street and King Street in Shawnee, Kansas. The purpose of this study was to assess the impact of the proposed development on the surrounding transportation system.

Included in this study is a discussion of the anticipated impact of the proposed development on the adjacent street network and identified improvements to mitigate deficiencies for the following scenarios:

- ▶ Existing Conditions
- ▶ Existing plus Development Conditions

We trust that the enclosed information proves beneficial to you and the City of Shawnee in this phase of the development process. We appreciate the opportunity to be of service to you and will be available to review this study at your convenience.

Sincerely,
TRANSYSTEMS

Introduction

TranSystems has completed a traffic impact study for the proposed 5700 King development to be located generally in the southwest corner of 57th Street and King Street in Shawnee, Kansas. The purpose of this study was to assess the impact of the proposed development on the surrounding transportation system. The location of the development site relative to the major streets in the area is shown on **Figure A-1** in **Appendix A**.

This study also contains a description of the proposed development and the surrounding transportation infrastructure along with trip generation estimates, trip distribution estimates, capacity analyses, and a summary of the findings. The scope of this study was developed in conjunction with Shawnee Public Works staff.

Proposed Development Plan

The proposed development is a five-story apartment building totaling 237,897 square feet. There are 188 proposed apartment units, ranging from studios to three bedroom apartments.

Access for the development will be provided from one full-access driveway that is in the same location as the existing conditions. The site drive will remain on King Street, adjacent to the 57th Terrace intersection. Parking will be provided within the proposed building's parking garage level. There will also be on-street angle parking constructed on Flint Street, 57th Street, and King Street surrounding the site. A copy of the proposed site plan showing the access points is included on **Figure A-2** in **Appendix A** for reference.

Study Area

To assess the impacts of the proposed development, the intersections listed below were identified for study during the A.M. and P.M. periods of a typical weekday.

- ▶ Johnson Drive and Nieman Road
- ▶ Johnson Drive and Flint Street
- ▶ 57th Terrace and King Street
- ▶ Site Driveways

Traffic Counts

The turning-movement traffic volume counts were collected at two of the three study intersections on Tuesday, January 28, 2020. The turning movement counts were collected from 7:00 to 9:00 A.M. and from 4:00 to 6:00 P.M. The turning movement counts at the intersection of Flint Street and Johnson Drive were provided from the Shawnee Public Works Department. The A.M. turning movement counts were collected on Friday, July 20, 2018 and the P.M. counts were collected on Tuesday, July 24, 2018.

The A.M. peak hour at the two Johnson Drive intersections occurred between 7:30 and 8:30 A.M., however the peak hour occurred between 8:00 and 9:00 A.M. at the intersection of King Avenue and 57th Terrace. The P.M. peak hour at each of the study intersections varied. The P.M. peak hour occurred between 4:45 and 5:45 P.M. at the intersection of Nieman Road and Johnson Drive. The P.M. counts at

Johnson Drive and Flint Street were adjusted to balance with the 2020 count volumes. The existing lane configurations, traffic control devices, and peak hour traffic volumes have been illustrated on **Figures A-3** and **A-4**.

Surrounding Land Uses and Street Network

The proposed development site exists consists of a museum and surface parking lot within a residential neighborhood. The development site is bounded on the north by 57th Street, the east by King Avenue, and the west by Flint Street. The south side of the property is bounded by a shared parking lot with a waterpark. The proposed site is near Downtown Shawnee.

Nieman Road is classified as a minor arterial roadway by the City of Shawnee Comprehensive Plan. The segment near the development site is a four-lane road with curb and gutter. Both sides of the street have sidewalks. The segment of Nieman Road that is adjacent to the proposed development is undergoing a road diet and will be reduced to three-lanes, including a continuous center two-way left-turn lane. The speed limit is 35 mph.

Johnson Drive is classified as a four-lane minor arterial roadway. The street has curb and gutter, sidewalk, and on-street parking on both sides of the street. The intersections with Nieman Road and Flint Street are signalized. The posted speed limit is 30 mph.

King Avenue is a two-lane local street with curbs and gutters on both sides. South of 58th Street, there is sidewalk and on-street angled parking on both sides of the street. There is sidewalk on the west side of the street between 57th and 58th Street. The speed limit is 25 mph. 57th Terrace is also a local road with a speed limit of 25 mph. There is some on-street angled parking adjacent to the development site.

Flint Street, adjacent to the proposed development, is a minor collector roadway. It is a two-lane street with curbs and gutters along each side of the road. The speed limit is 25 mph.

Analysis

The scope of analysis for the assessment of the proposed development's impact on the surrounding transportation system is largely based on the recommended practices of the Institute of Transportation Engineers (ITE), as outlined in their Traffic Engineering Handbook. ITE is a nationally-recognized organization of transportation professionals with members from both private and public sectors. The analysis of the proposed development's impact included development of trip generation and trip distribution estimates as well as a traffic operations assessment for each study scenario. Each of the analysis methodologies and findings are described in the subsequent sections.

Trip Generation

Trip generation estimates were prepared using the Institute of Transportation Engineer's Trip Generation, 10th Edition. **Table I** on the following page shows the expected trips to be generated by the proposed development.

**Table I
Trip Generation**

Land Use	Intensity	ITE Code	Average Weekday	A.M. Peak Hour			P.M. Peak Hour		
				Total	In	Out	Total	In	Out
Mid-Rise Multi-Family Housing	188 units	221	1,023	64	17	47	82	51	31

Trip Distribution

The estimated trips generated by the proposed development were distributed onto the street system based on the trip distributions summarized in **Table 2**. These distributions are based on existing traffic patterns and engineering judgment. The detailed distribution patterns through the study intersections are shown in **Appendix B**.

**Table 2
Trip Distribution**

Direction To/From	Percentage
North on Nieman Road	15%
South on Nieman Road	25%
East on Johnson Drive	35%
West on Johnson Drive	25%
Total	100%

Traffic Operation Assessment

An assessment of traffic operations was made for the scenarios listed below. These scenarios allowed for comparison of the before and after impacts of the proposed development on the street network.

- ▶ Existing Conditions
- ▶ Existing plus Development Conditions

The study intersections were evaluated using the Synchro traffic analysis software package. Calculations were performed based on the methodologies outlined in the Highway Capacity Manual (HCM), 6th Edition, which is published by the Transportation Research Board. The operating conditions at an intersection are graded by the “level of service” experienced by drivers. Level of service (LOS) describes the quality of traffic operating conditions and is rated from “A” to “F”. LOS A represents the least congested condition with free-flow movement of traffic and minimal delays. LOS F generally indicates severely congested conditions with excessive delays to motorists. Intermediate grades of B, C, D, and E reflect incremental increases in the average delay per stopped vehicle. Control delay is measured in seconds per vehicle. **Table 3** on the following page shows the upper limit of delay associated with each level of service for signalized and unsignalized intersections.

Table 3
Intersection Level of Service Delay Thresholds

Level of Service (LOS)	Signalized	Unsignalized
A	≤ 10 Seconds	≤ 10 Seconds
B	≤ 20 Seconds	≤ 15 Seconds
C	≤ 35 Seconds	≤ 25 Seconds
D	≤ 55 Seconds	≤ 35 Seconds
E	≤ 80 Seconds	≤ 50 Seconds
F	> 80 Seconds	> 50 Seconds

While LOS measurements apply to both signalized and unsignalized intersections, there are significant differences between how these intersections operate and how they are evaluated. LOS for signalized intersections reflects the operation of the intersection as a whole.

Unsignalized intersections, in contrast, are evaluated based on the movement groupings which are required to yield to other traffic. Typically, these are the left turns off of the major street and the side-street approaches for two-way stop-controlled intersections. At unsignalized intersections lower LOS ratings (D, E and F) do not, in themselves, indicate the need for additional improvements. Many times there are convenient alternative routes to avoid the longer delays. Other times the volumes on the unsignalized approaches are relatively minor when compared to the major street traffic, and improvements such as traffic signal installation may increase the average delay to all users of the intersection.

The LOS rating deemed acceptable varies by community, facility type and traffic control device. Most communities in the region have identified LOS D as the minimum desirable goal for signalized intersections. However, at unsignalized intersections LOS D, E, or even F are often considered acceptable for low to moderate traffic volumes where the installation of a traffic signal is not warranted by the conditions at the intersection, or the location has been deemed undesirable for signalization.

The decision to install a traffic signal, which is often considered when lower LOS ratings are projected, should be based on engineering studies and the warrants for traffic signal installation as outlined in the Federal Highway Administration's Manual on Uniform Traffic Control Devices (MUTCD). Signals are typically not recommended in locations where there are convenient alternative paths, or if the installation of a traffic signal would have negative impacts on the surrounding transportation system.

Traffic queues were also evaluated as part of the analyses. Long traffic queues which extend beyond the amount of storage available, either between intersections or within turn lanes, can have significant impacts on operations. The projected vehicular queues were analyzed to ensure the analyses are reflective of the physical constraints of the study intersections and to identify if additional storage is needed for turn lanes.

Existing Conditions

The segment of Nieman Road adjacent to the proposed development was under construction at the time of this study. The lane configuration at the intersection of Nieman Road and Johnson Drive will be affected, as Nieman Road will be a three-lane roadway. The lane configurations in the northbound and southbound directions will change into one right-turn, one left-turn, and one through lane. The lane configurations will remain the same on Johnson Drive at this intersection. These improvements are included in **Figure A-3**.

The results of the Existing Conditions intersection analyses are summarized below in **Table 4**. The study intersections were evaluated with the lane configurations, traffic volumes, and traffic control devices shown on **Figures A-3** and **A-4**. The Synchro output files are included in **Appendix C**. The new lane configurations and traffic signal phasing at Johnson Drive and Nieman Road were used for the Existing Conditions analysis.

Table 4
Intersection Operational Analysis
Existing Conditions

Intersection	Movement	A.M. Peak Hour		P.M. Peak Hour	
		LOS ¹	Delay ²	LOS ¹	Delay ²
Johnson Drive and Nieman Road	<i>Traffic Signal</i>	C	26.5	C	29.8
Johnson Drive and Flint Street	<i>Traffic Signal</i>	A	4.0	A	3.6
57th Terrace and King Avenue	<i>Eastbound</i>	A	8.8	A	8.8
	<i>Westbound</i>	A	8.9	A	8.7
	<i>Northbound Left-Turn</i>	A	7.2	A	7.2
	<i>Southbound Left-Turn</i>	A	0.0	A	0.0

1 – Level of Service

2 – Delay in seconds per vehicle

The results in the table indicate that all study intersections currently operate at acceptable levels of service during the peak hours. All queues are contained within their respective lanes.

Existing plus Development Conditions

The results of the Existing plus Development Conditions intersection analyses are summarized in **Table 5**, on the following page. The study intersections were evaluated with the lane configurations, traffic volumes, and traffic control devices shown on **Figures A-5** and **A-6**. The Synchro output files are included in **Appendix C**.

The results in **Table 5** indicate that all study intersections are projected to operate at acceptable levels of service during the peak hours with the addition of development traffic. All queues are contained within their respective lanes.

Table 5
Intersection Operational Analysis
Existing plus Development Conditions

Intersection	Movement	A.M. Peak Hour		P.M. Peak Hour	
		LOS¹	Delay²	LOS¹	Delay²
Johnson Drive and Nieman Road	<i>Traffic Signal</i>	C	26.7	C	30.0
Johnson Drive and Flint Street	<i>Traffic Signal</i>	A	4.4	A	3.8
57th Terrace and King Avenue	<i>Eastbound</i>	A	8.6	A	8.8
	<i>Westbound</i>	A	9.3	A	9.5
	<i>Northbound Left-Turn</i>	A	7.3	A	7.3
	<i>Southbound Left-Turn</i>	A	0.0	A	0.0

1 – Level of Service

2 – Delay in seconds per vehicle

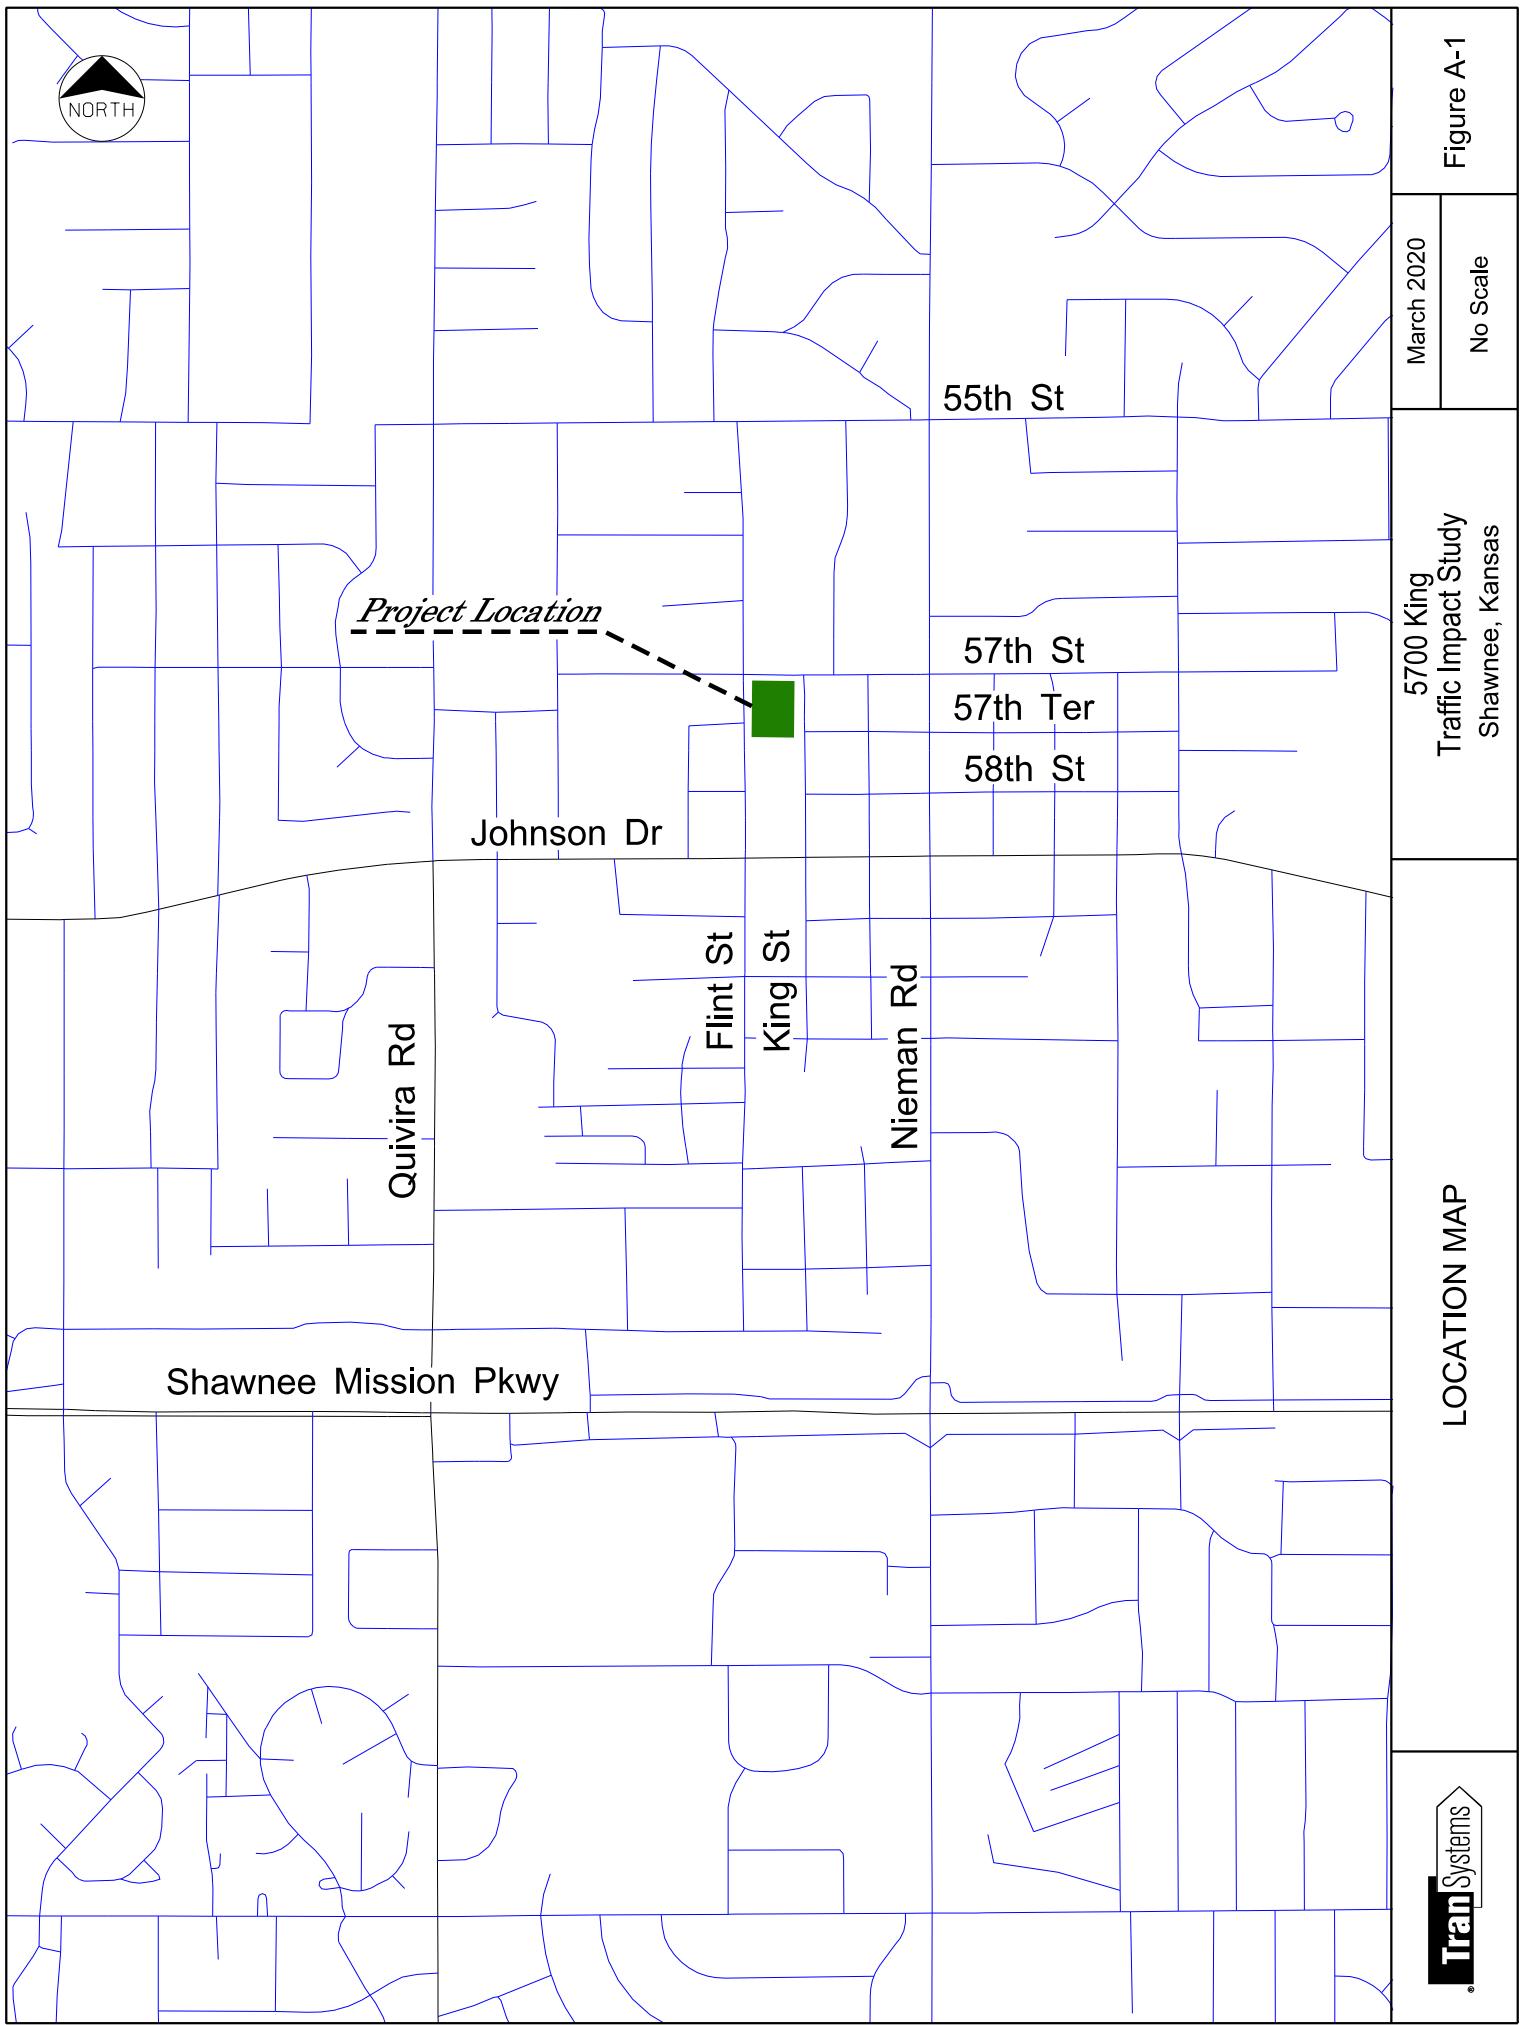

Summary

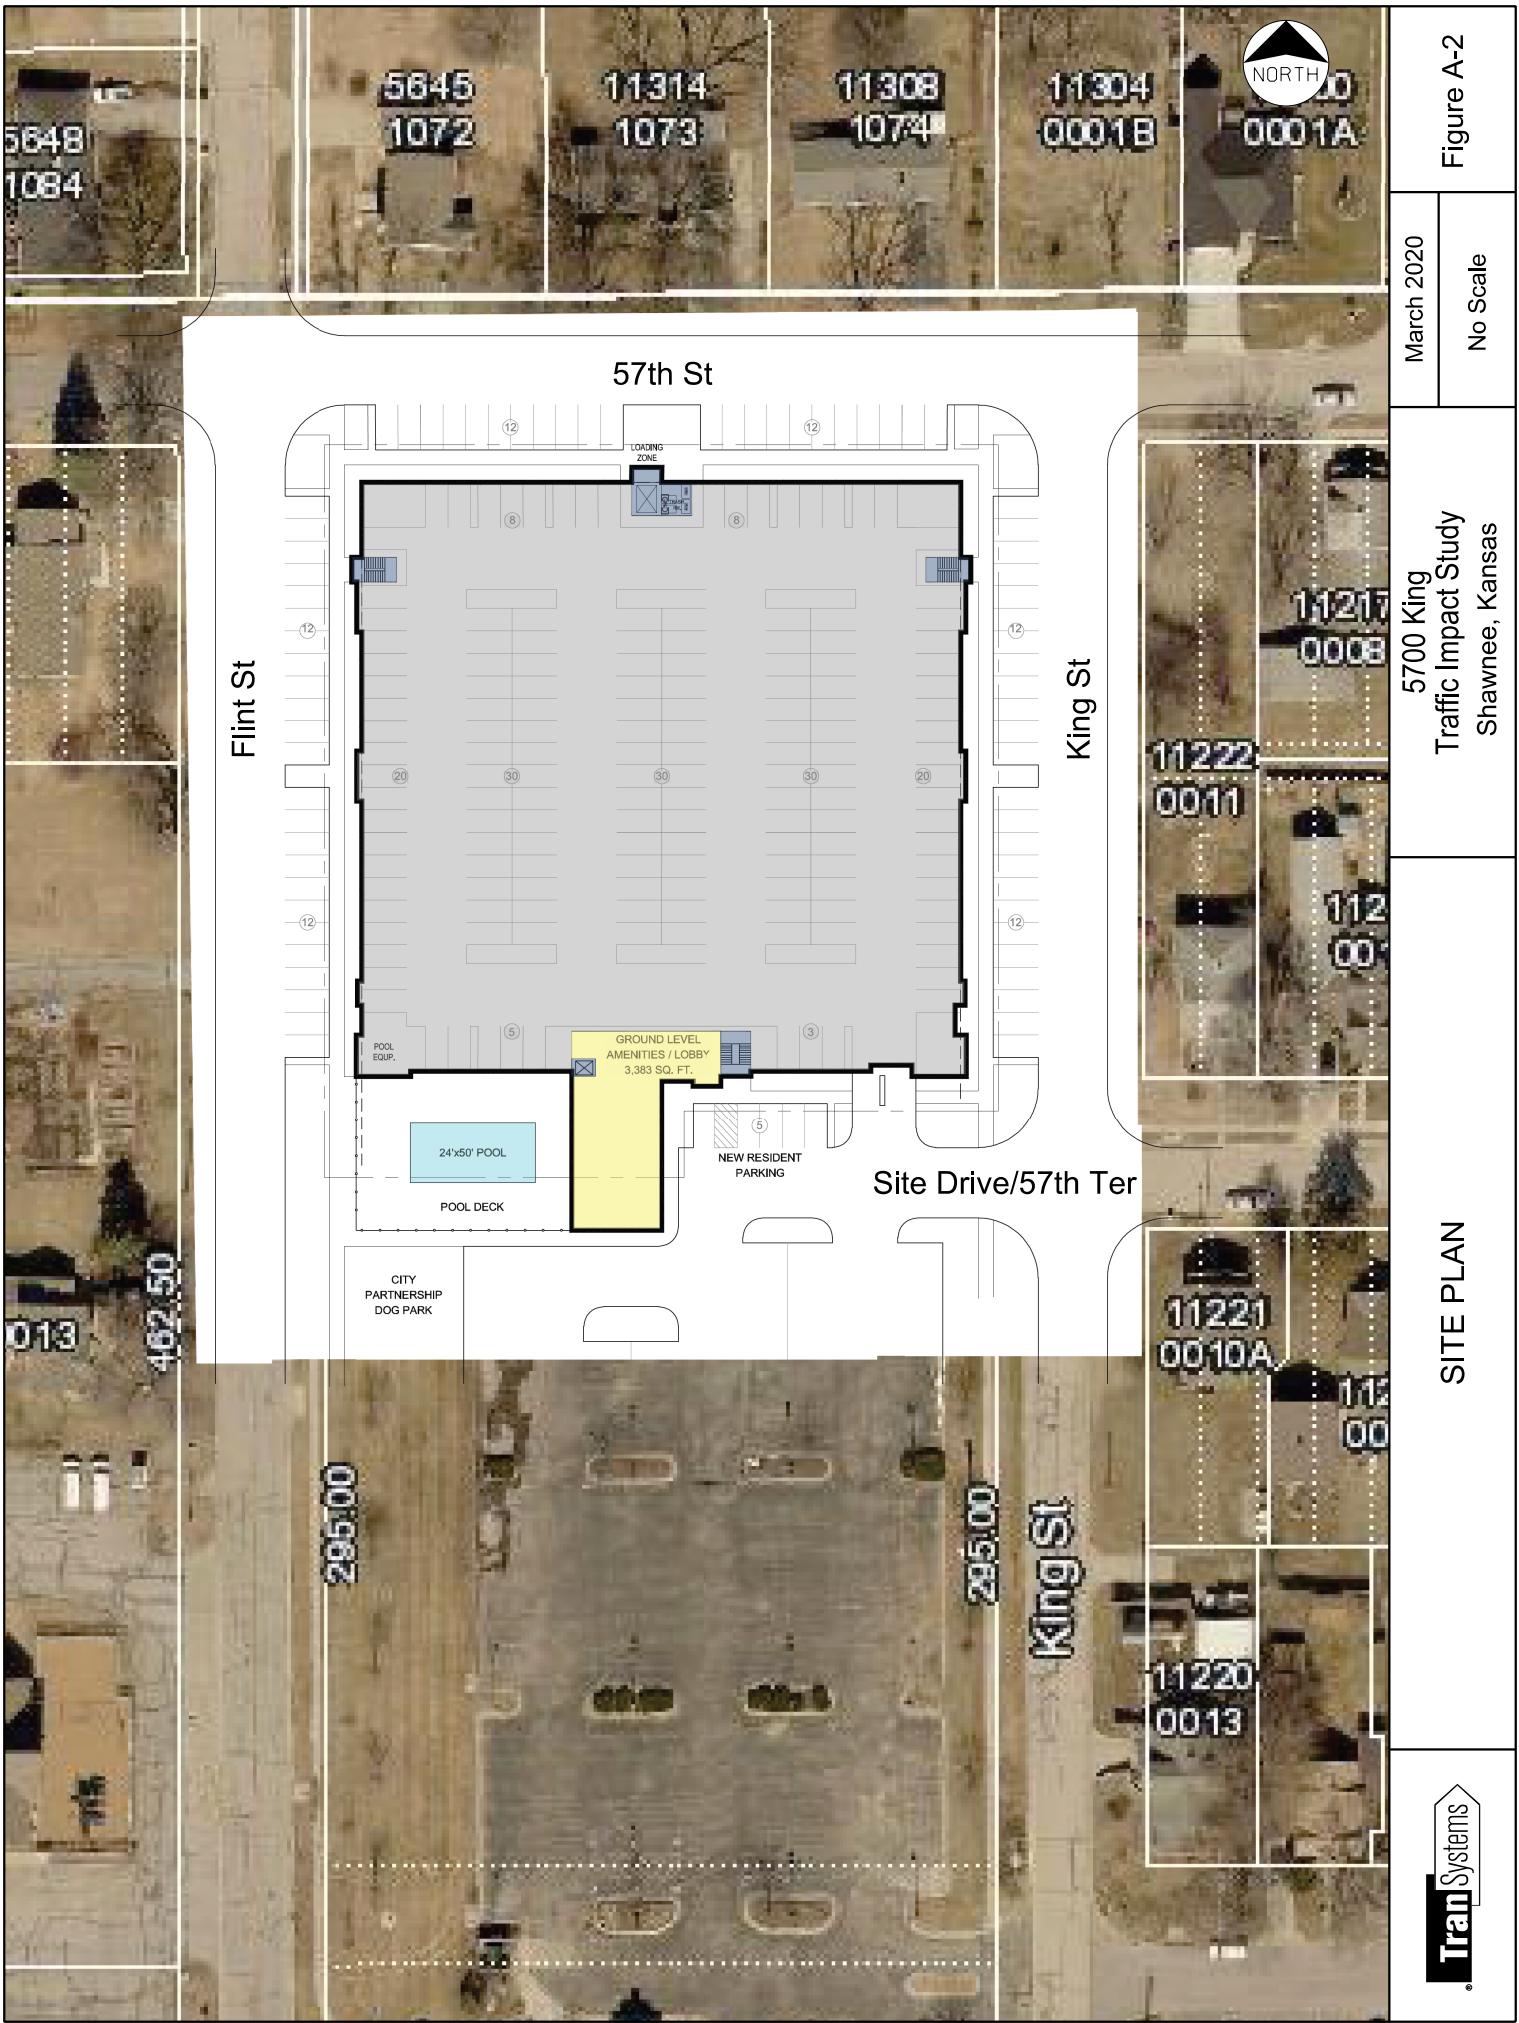

TranSystems has completed a traffic impact study for the proposed 5700 King development to be located generally in the southwest corner of 57th Street and King Street in Shawnee, Kansas. The purpose of this study was to assess the impact of the proposed development on the surrounding transportation system.

The proposed development is projected to generate 64 vehicular trips in the A.M. peak hour and 82 vehicular trips in the P.M. peak hour. All study intersections are projected to continue operating at acceptable levels of service with the addition of development traffic. No improvements are necessary to mitigate the addition of the development traffic.
